                                                                                                                                                                                                      This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have cytostatic activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. AAZ52858-Z53014 represent expressed sequence tag (EST) fragments derived from a human pancreatic tumor cDNA library and which encode the proteins represented
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human prostate tumor cDNA library derived
                                                                                                                                                                                     represent expressed se pancreatic tumor cDNA in AAY73814-Y74252.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1999-621386/54.

CC The present invention describes an isolated antibody that binds to CC one of the human PRO proteins designated PRO212, PRO290, PRO341, PRO355, CC PRO619, PRO717, PRO809, PRO830, PRO848, PRO943, PRO1005, PRO1009, PRO3111, PRO1055, PRO11009, PRO1187, PRO1030, PRO1097, PRO1107, PRO1111, PRO1152, PRO1182, PRO1182, PRO1187, PRO1187, PRO1181, PRO23, PRO39, PRO834, PRO1317, PRO1710, PRO2094, CC PRO1187, PRO1281, PRO23, PRO39, PRO834, PRO1317, PRO1710, PRO2094, CC PRO1187, PRO1281, PRO23, PRO39, PRO834, PRO1317, PRO1710, PRO2094, CC PRO1187, PRO1281, PRO23, PRO39, PRO834, PRO1317, PRO1710, PRO2094, CC C reatment, diagnosis and prevention of cancer. The antibodies and other CC anti-tumour compounds maybe used to treat various conditions, including CC those characterised by overexpression and/or activation of the amplified CC PRO genes. Exemplary conditions or disorders to be treated with such CC antibodies and other compounds include benign or malignant tumours (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, CC (e.g., renal, liver, kidney, kidney, kidney, kidney, kidney, kidney, ki

have anticancer activity and are highly expressed in ovarian tumor tissue (and some also in testis and breast cancer tissue). The products of the invention can be used for gene therapy. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of ovarian cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTs (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represent different
                                                  parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAZ77450-Z77572 represent the human ovarian tumor cDNA library derived EST fragments described in the metho of the invention and encode the protein fragments represented in AAY76505-Y76638.

N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. By inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the

This cDNA clone codes for huXAG-1 (see AAW37844), a member of a novel family of human growth factors also including huXAG-2 (see AAW37845)

Claim 5; Fig 1; 141pp; English.

```
Colon cancer specific gene (CCSG), provides a molecular marker for CC colon cancer. huXAG-1 cDNA was isolated from a cDNA library CC derived from human colon cancer tissue. Vectors, host cells, and streaming methods for identifying agonists and CC antibodies, and screening methods for identifying agonists and CC antagonists of huXAG-1 are provided. HuXAG polypeptides are growth CC factors and can be used to stimulate proliferation of cells. They CC can be used to stimulate the proliferation and differentiation of CC such as fulminant liver failure caused by cirrhosis, liver damage CC caused by viral hepatitis and toxic substances. They can also be used to stimulate or promote liver regeneration, e.g. after considered by various pathological states. They can be used to stimulate proliferation and differentiation and promote the repair CC simulate proliferation and differentiation and promote the repair CC creat acute or chronic lung damage, e.g. emphysema, which results considered to the bronchiolar epithelium to prevent, attenuate, or creat acute or chronic lung damage, e.g. emphysema, which results considered to promote healing of breast tissue and could therefore be used to promote healing of breast tissue considered to promote healing of breast tissue and could therefore be used to promote healing of breast tissue considered to promote the proliferative disorders, including cancer, in colon cancer. The products can also be used for colon cancer. The products can also be used for detection and collaboration cancer, in the properties of the products can also be used for detection and collaboration cancer. The products can also be used for detection and collaboration cancer. The products can also be used for detection and collaboration cancer. The products can also be used for detection and collaboration cancer. The products can also be used for detection and collaboration cancer.

These proteins share homology with the XAG protein of Xenopus laevis, which is involved in embryogenesis and is expressed in adult tissue. Expression of huXAG-1 has been discovered in colon cancer tissue, with no corresponding expression in healthy colon tissue. The huXAG-1 gene, also designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 875

CC Rhown as a colon cancer specific gene (CCSG). HuxAG-1 sliver factor polypeptide huxAG-1 also CC known as a growth factor. The HuxAG-1 protein is useful for CC identifying compounds capable of enhancing or inhibiting cellular CC response induced by huxAG-1. The protein is also useful for CC proliferation of cells e.g. colon, breast, liver and lung cells, and CC pathologies such as fulminant liver failure caused by cirrhosis, liver CC damage caused by viral hepatitis and toxic substances, for preventing and CC treating damage to the lungs caused by various pathological states and CC cancer. HuxAG-1 and the identified antagonist are useful for treating cancer of cancer in particular colon cancer. Detecting altered levels of huxAG-1 and its polynucleotides are useful for diagnosing or detecting cancer in mammals. The gene encoding huxAG-1 is useful for monitoring human Novel human growth factor polypeptide useful for diagnosing and treating colon cancer and liver diseases, to prevent and heal damage to the lungs and for identifying modulators of therapeutic use . The products of the invention can be used in the stand treatment of e.g. tumour metastasis, bacterial colonisation, susceptibility to and persistence of infection, microbial infections, AIDS, cystic fibrosis, chronic obstructive pulmonary disease, asthma, sinonasal inflammatory disease, inflammatory bowel disease, bronchitts or Crohn's disease. The products can also be used for detection,

                                                                                                                                                                                                                                                                                                                                                                                                   This sequence encodes a human secreted protein of the invention. The CC extended cDNAs (or genomic DNAs obtainable from them) may be used to CC prepare PCR primers and probes. These are useful for forensic matching or CC positive identification by DNA sequencing. They may also be used in CC alternative fingerprint identification techniques. Antibodies against the CC proteins encoded by the extended cDNAs are useful in identification of CC tissue types or cell species, as well as identifying tissue specific CC soluble proteins. The sequences can be used for chromosome mapping and CC identification of genes associated with hereditary diseases or drug CC response. signal sequences from the cDNAs can be used in construction of CC used to clone upstream genomic DNA sequences including promoters. This is in turn useful for identifying proteins that interact with promoter CC sequences. Some of the proteins may be useful in diagnosing and treating CC cardiovascular and neurodegenerative disorders, autoimmune diseases, and CC rheumatic diseases, embryogenic disorders, hypertension, renal injury, amino accidurias, hypoglycaemia, male rat inferrility and mycorathics.

The extended CDNAs (or genomic DNAs obtainable from them) may be used to prepare PCR primers and probes. These are useful for forensic matching or consitive identification by DNA sequencing. They may also be used in alternative identification by DNA sequencing. They may also be used in call the proteins encoded by the extended cDNAs are useful in identification of tissue types or cell species, as well as identifying tissue specific concluding proteins. The sequences can be used for chromosome mapping and contentification of genes associated with hereditary diseases or drug cresponse. signal sequences from the cDNAs can be used in construction of secretion vectors. Other sequences derived from the extended cDNAs can be used to clone upstream genomic DNA sequences including promoters. This is in turn useful for identifying proteins that interact with promoter sequences. Some of the proteins may be useful in diagnosing and treating several disorders including, but not limited to: cancer, hyperlipidaemia, cardiovascular and neurodegenerative disorders, autoimmune diseases, and rheumatic diseases, embryogenic disorders, hypertension, renal injury, amino acidurias, hypoglycaemia, male rat infertility and myopathies.

                                                                                         breast cancer
```

The invention describes the novel use of a protein found in breast cancer cell membranes (BCMP 7) for diagnosing, preventing and treating breast cancers. The peptide has cytostatic action and potential uses in gene therapy and in vaccines. The polypeptide, antisense nucleic acids, or fusion proteins comprising and Green Fluorescent protein or the DsRe Fluorescent protein, antibodies specific for and/or nucleic acid are

DsRed ij

Antibodies against may also be used for screening for and/or diagnosis of breast cancer in a patient. The method for monitoring/assessing breast cancer treatment in a patient and for the identification of metastatic breast cancer cells in samples from a patient. This sequence encodes breast cancer cell associated protein 7 (BCMP 7), located on chromosome 7p21.3, described in the method of the invention.

Its proteins can be used as nutritional sources or supplements. The proteins may also have cytokine functions, immune modulating functions, haematopoiesis regulating activity, activin/inhibin regulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               201
 The invention provides isolated human lung tumor nucleic acids and polypeptides. The polypeptides can be used for the treatment of lung cancer. The polypeptides and polypucleotides can be used to stimulate cells or antigen presenting cells for use in the treatment of lung
                                                                                                                                                                                                                                                                                                                                                                                                        501

                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel isolated polypeptide (I) which comprising an immunogenic portion of a lung tumor protein or variant (P2) which have cytostatic activity. The polypeptides and polypuncleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient are treated with P2, polynucleotides encoding P2 or antigen presenting cells expressing P2 and then administered to the patient to inhibit development of cancer.
